

GIVE THAT GRASS SOME GAS

Now that we are entering summer, it's time to prepare your customers' lawns to better tolerate the forces of nature that are surely coming. As we all know, the optimum growing weather we've been experiencing will soon be a distant memory. Turf areas will start becoming stressed as the temperatures continue to climb and the sun becomes unrelenting. As stress is introduced, the turf is weakened and will therefore be more susceptible to other issues and diseases. A little preventative maintenance now will reduce stressors and will help keep your customers' lawns lush and green for the duration of the summer season.

Apply ¼" to 1" of one of SBS' top dressings to the turf areas. Our Top Dressings are 100% organic and have been finely sized to provide very consistent and small-scale particles that will work best in a lawn-fortifying application.

We remove the largest pieces that would have otherwise been unsightly if left on the lawn. All the SBS Top Dressings provide the benefit of supplying increased nitrogen, delivering water-storage capacity, and making available other biological properties that enhance the grounds in an ongoing and sustainable manner.

The Top Dressings are to be applied to the lawn thru a broadcast spreader, drop spreader, or even hand-spread, as you would with fertilizer. The finely textured top dressing particles will nestle themselves between the blades of grass to help avoid seeing the material on the surface. For added effectiveness it is recommended that your customer allow you to aerate the lawn before applying, so that a portion of the material falls into the aeration holes to help transform the root zone where it can most efficiently feed and promote a healthy and deep root system. After the top dressing application you should lightly wet the area to help seat the material between the grass blades.

We offer the following Top Dressings in bags, bulk or super sacks.

- ◆ *Dairy Top Dressing* – Most finely textured and provides the lawn a great nitrogen boost
- ◆ *Professional Top Dressing* – Finely textured vegetative-based compost – most attractively priced
- ◆ *pH Balanced Top Dressing* – Finely textured pH Balanced Compost-based material, helps to reduce the pH and increase germination when applying new seed
